Resumen

Se realizó un crucero oceanográfico en la costa oeste de la Península de Baja California, con el objetivo de proveer un entendimiento integral y una capacidad predictiva de la respuesta oceánica a la variabilidad climática y al cambio climático y sus consecuencias en el ecosistema pelágico de la región sur de la Corriente de California. El crucero BIPO-INAPESCA 1407 da continuidad a las campañas realizadas anteriormente por IMECOCAL y amplía la zona de estudio. Este crucero se efectuó del 7 de julio al 9 de septiembre de 2014. Durante la campaña se realizaron 210 lances de CTD para obtener datos hidrográficos en 193 estaciones. En el presente informe se describe la adquisición y el procesamiento de los datos de presión, temperatura, conductividad (salinidad), oxígeno disuelto y clorofila. Los datos procesados se presentan tabulados a niveles de profundidad estándar. Se muestran también perfiles completos de los datos (a cada decíbar) y gráficas de contornos verticales y horizontales de las diferentes variables medidas.

Introducción

La costa este del océano Pacífico, frente a la Península de Baja California alberga una gran cantidad de recursos pesqueros que son de importancia ecológica y comercial para la región. La distribución espacial y temporal de las propiedades fisicoquímicas del agua de mar (temperatura, salinidad, densidad) influyen en la distribución de las poblaciones de peces pelágicos. En este informe se presentan la distribución espacial de variables fisicoquímicas medidas durante el crucero BIPO-INAPESCA realizado del 7 de julio al 9 de septiembre de 2014.

Este crucero está basado en el programa de Investigaciones Mexicanas de la Corriente de California (IMECOCAL). El área cubierta es una zona ampliada sobre los realizados anteriormente dentro de IMECOCAL. En esta campaña se cubrió un recorrido en la región del Pacífico oriental frente al Península de Baja California, desde 5 km en la zona más costeras hasta 540 km costa afuera en la parte más occidental. Geográficamente cubrió desde 21° N hasta 32° N y desde 110° E hasta 122° E.

La campaña oceanográfica BIPO-INAPESCA 1407 fue efectuada a bordo del Buque de Investigación Pesquera y Oceanográfica (BIPO) propiedad del Instituto Nacional de Pesca (INAPESCA) del 7 de julio al 9 de septiembre de 2014. A lo largo de las 193 estaciones muestreadas (figura 1) se realizaron 210 lances de CTD. En todas las estaciones se tomaron muestras de agua (roseta SBE) para la determinación de oxígeno disuelto, clorofila y nutrientes. Se recolectaron muestras de agua en diecisésis estaciones para la realización de igual número de experimentos de productividad primaria. La nomenclatura 1407 indica que fue iniciado en julio (07) del año 2014 (14).

Las observaciones de rutina incluyeron además mediciones continuas de variables meteorológicas (temperatura del aire, humedad relativa, presión atmosférica, rapidez y dirección del viento) y de variables fisicoquímicas medidas en forma continua en la superficie del océano (temperatura del agua, salinidad, fluorescencia del fitoplancton, pH y presión parcial del dióxido de carbono) por medio de la toma de agua en el casco del buque. En este informe se presentan únicamente los datos hidrográficos obtenidos a partir de los lances de CTD.

La red de estaciones oceanográficas muestreadas es un subconjunto de la red original del programa CalCOFI, el cual inició observaciones frente a California y Baja California en 1949. Asimismo, las estaciones se denominan conforme a la práctica CalCOFI, mediante números de

líneas hidrográficas perpendiculares a la costa y números de estaciones separados por un punto. En el apéndice A se muestra el número secuencial del lance de CTD, el nombre, la posición geográfica y profundidad de las estaciones, y la presión (db), hora y fecha al inicio lance de CTD (en UTC).

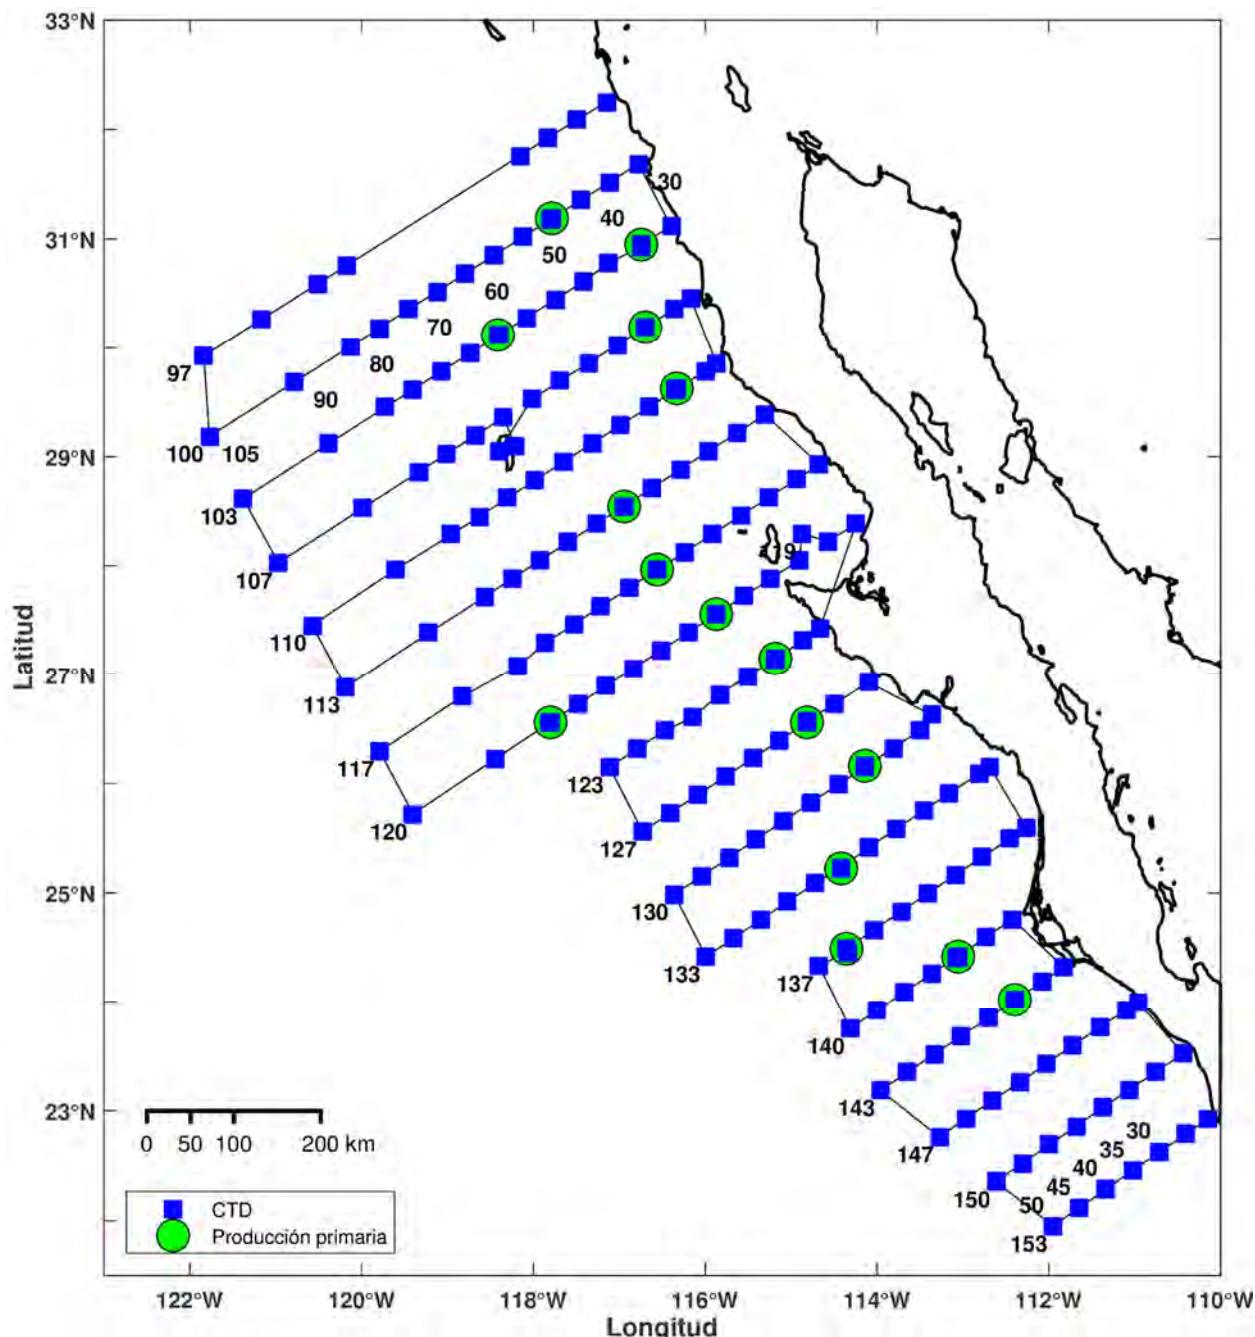

Figura 1. Área de estudio y posición de estaciones para la campaña BIPO-INAPESCA 1407. La red y nomenclatura de las estaciones sigue la del programa CalCOFI. La línea continua entre estaciones indica la ruta de navegación, iniciada en la estación 97.30 y finalizada en la estación 153.15

Metodología

En esta sección se describe la metodología del procesamiento de los datos hidrográficos. La descripción sigue un orden cronológico, desde la descripción del sistema y los instrumentos, la forma en que fueron adquiridos, la calibración que se llevó a cabo, la identificación y eliminación de errores y su presentación final. El software que se utilizó para el procesado de los datos fue el provisto por el fabricante del CTD, SBE Data Processing v 7.23.2 2014.

Descripción del sistema CTD

Durante el crucero se pretendió utilizar un sistema de CTD modelo SBE-911*plus*, fabricado por Sea-Bird Electronics Inc., el cual transmite los datos en tiempo real desde la unidad submarina hasta la computadora a bordo por medio de un cable conductor. En los primeros cuatro lances no se obtuvieron lecturas confiables posiblemente por algún defecto en el cable conductor. Para obtener lecturas confiables se decidió utilizar un CTD autónomo modelo SBE-19 V2 en los lances 5 al 16, cuya calibración era más reciente. En los lances 17 a 210 se utilizó un CTD modelo SBE-19 de características similares que además contaba con sensores de fluorescencia y oxígeno. Para la toma de muestras de agua se utilizó una roseta SBE 32 en conjunto al sistema CTD SBE-911*plus*, debido a los fallos presentados este solo se usó para el disparo remoto de las botellas. Los datos de los perfiles provienen únicamente del CTD autónomo. Todo el sistema se montó en una jaula de acero y se descendió por la borda de estribor por medio de un cable de acero conductor y el malacate del barco.

La unidad SBE-19 y SBE-19V2 consiste en una caja de presión que en su interior contiene la electrónica necesaria para la adquisición y almacenamiento de los datos. En su exterior provee de cuatro y seis canales de entrada para conectar instrumentos opcionales respectivamente. Internamente cuenta con sensores de temperatura, conductividad y presión. Externamente en la unidad SBE-19 se utilizaron sensores de oxígeno y fluorescencia.

Los sensores que se utilizaron en el crucero así como las especificaciones técnicas se presentan en la Tabla 1.

Tabla 1: Especificaciones técnicas de los sensores del CTD.

Instrumento	Lances	Frecuencia de muestreo	Temperatura	Conductividad	Presión	Oxigeno	Fluorescencia	Calibración
SBE 19	5 a 16	4Hz	± 0.005 °C	± 0.0005 S/m	± 0.1%	ND	ND	07-agosto-12
SBE 19v2	17 a 210	4Hz	± 0.005 °C	± 0.0005 S/m	± 0.1%	± 2%	0.03 µg/I	26-julio-13

Adquisición de los datos

Después de detenerse la marcha del buque al llegar a cada estación se encendió el interruptor magnético del CTD este inmediatamente empezó a registrar en la memoria interna la información de los sensores. Después de procedió a descender la unidad a 16 metros por minuto hasta superar los 500 m de profundidad. Al llegar a la máxima profundidad se registró la hora y fecha y se regresó la unidad a cubierta a la misma velocidad. Una vez en cubierta se interrumpe el registro de datos al cambiar la posición del interruptor magnético a la posición de apagado. El encendido y apagado del interruptor genera un indicador de cada lance realizado y de los datos asociados a este en la memoria interna del CTD. Aproximadamente después de cada 5 lances los datos fueron recuperados de la memoria del CTD en archivos en la computadora de a bordo para su posterior procesamiento. La transferencia de los datos se hizo por medio de la interface serial RS-232 de acuerdo a las recomendaciones del fabricante. Cada lance genera un archivo con información hexadecimal al cual se le denomina “crudo”.

Tratamiento de los datos

Los archivos crudos contienen información codificada en hexadecimal de los valores de voltaje de los sensores del CTD. El primer tratamiento que se dio fue el de convertir los datos crudos a valores de las variables medidas usando el archivo de configuración que contiene la información de las constantes de calibración. El tratamiento incluye tanto datos provenientes del descenso como del ascenso del instrumento.

Debido a la rápida respuesta del sensor de presión, el fabricante recomienda aplicar un filtro pasa bajo a los sensores de presión y a los de temperatura y conductividad. Siguiendo el esquema de procesamiento del fabricante en el módulo FILTER, al primero se le aplicó un filtro con una constante de 0.15 s y a los otros dos se les aplicó un filtro con una constante de 0.2 s. Enseguida se identificaron datos erróneos en cada sensor por medio del módulo WILDEDIT. Con este módulo se leyeron los datos de cada sensor en bloques de 48 valores correspondiendo a 2 segundos de datos y se eliminaron los que diferían por más de 2 desviaciones estándar del bloque para después continuar con el siguiente bloque. En una segunda aplicación del método se excluyeron los datos que se alejaban más de 5 desviaciones estándar de la media, pero se conservaron los que no difieran por más de 0.001 de la misma.

Debido al diferente tiempo de respuesta de los sensores y la posición de éstos dentro de las tuberías del CTD se presenta un desfase en la medida de una variable en particular en la

vertical. Para los sensores de conductividad se aplicó una corrección de 0.625s mientras que al de temperatura el ajuste fue de 0.75 s.

Dentro de la celda de conductividad se genera un problema de capa límite (Lueck, 1991). Para corregirlo es necesario realizar un ajuste consistente en utilizar los valores típicos recomendados por el fabricante de α igual a 0.03 τ igual a 7 en el módulo CELL THERMAL MASS.

Para reducir el ruido en los diferentes sensores se aplicó un filtro simétrico triangular por medio del módulo WINDOW FILTER. Se usó una ventana de 15 datos en los sensores de presión, temperatura y conductividad.

Durante el lance del CTD el barco exhibe un movimiento vertical debido al efecto del oleaje. Esto provoca que la unidad subacuática se mueva de la misma manera y genere estelas de agua con propiedades alteradas. Con el módulo LOOPEDIT se redujo el efecto debido al cabeceo del barco, usando una velocidad mínima de bajada de 0.4 m/s. Con este mismo módulo se retiraron los datos al inicio del lance que correspondían al tiempo en que estuvo suspendido mientras se esperaba a que los sensores se stabilizaran dentro del agua. Enseguida, se utilizó el módulo BIN AVERAGE para realizar promedios de datos por bloques de profundidad. Se seleccionó una profundidad de 1 db y se separaron los lances de bajada y de subida.

Por último a partir de los datos de los sensores se calcularon variables secundarias como son salinidad y densidad (sigma-theta) usando las ecuaciones descritas por Fofonoff y Millard (1983). Estos algoritmos están integrados en el módulo DERIVE del paquete de procesamiento de datos del fabricante.

Determinación de concentración de clorofila-a

Durante la campaña se colectó agua de mar por medio de la roseta SBE 32 con el fin de cuantificar la concentración clorofila-a en las profundidades de 0, 10, 20, 50, 100, 150 y 200 m. El método empleado fue el de fluorometría sin acidificación descrita por Welshmeyer (1994). Para ello se filtró un litro de agua de mar a través de filtros tipo GF/F de 25 mm de diámetro con poro de 0.7 micras. Cada filtro fue colocado en una cápsula de plástico, etiquetada con estación, profundidad y crucero. Las cápsulas fueron congeladas en nitrógeno líquido a -198 °C para su posterior procesamiento en el laboratorio.

En el laboratorio se retiró el filtro de la cápsula plástica, se colocó en un vial de centelleo de 20 ml previamente cubierto con papel de aluminio y se le añadió 10 ml de acetona al 90%. Posteriormente se mantuvo en refrigeración (4 °C) durante 24 hr. A este proceso se le llama

extracción pasiva (Venrick y Hayward, 1984). Al completarse la extracción, las muestras se mantuvieron a temperatura ambiente y en oscuridad durante media hora. En una celda de vidrio se colocaron 2 ml de muestra y se leyó el valor de fluorescencia emitida en un fluorómetro Trilogy de Turner Designs. Los valores de concentración de clorofila-a determinados por el instrumento están en unidades de mg m^{-3} y se reportan en el apéndice E

Presentación de datos

En el presente informe se presentan los datos del lance de descenso. Los datos de ascenso se muestran sólo en los casos en que el primero hubiera mostrado errores no corregibles.

En el diagrama TS de los datos del crucero 1407 (Fig. 2) se incluyeron las observaciones correspondientes a la climatología para esta temporada (verano) obtenida a partir de los cruceros previos de CalCOFI (1950-1978) e IMECOCAL (septiembre 1998 - julio 2011) en las mismas estaciones oceanográficas. Se muestra la salinidad absoluta (TEOS-10) y la temperatura *in situ* (ITS-90).

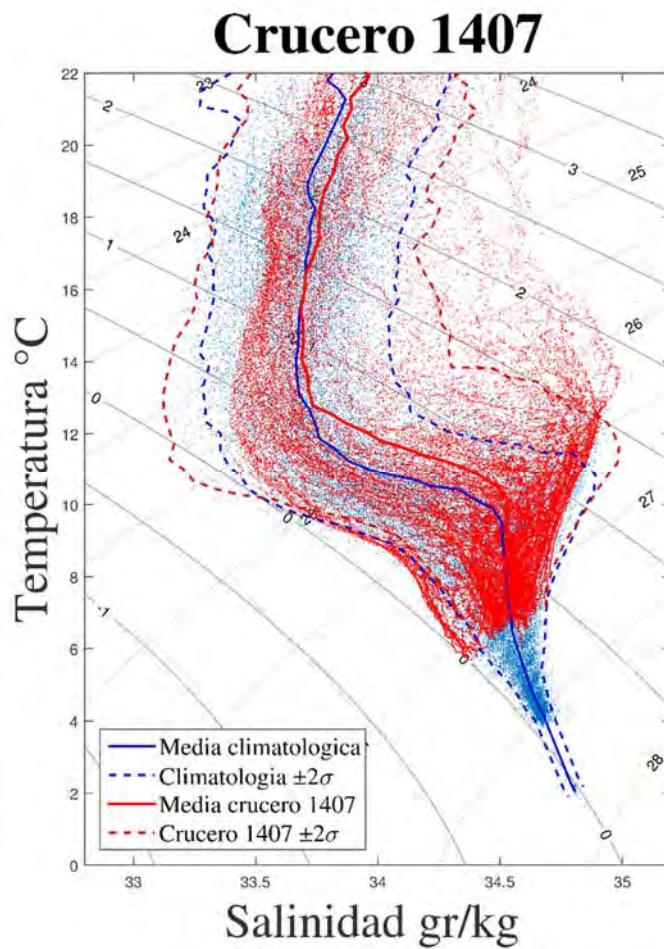

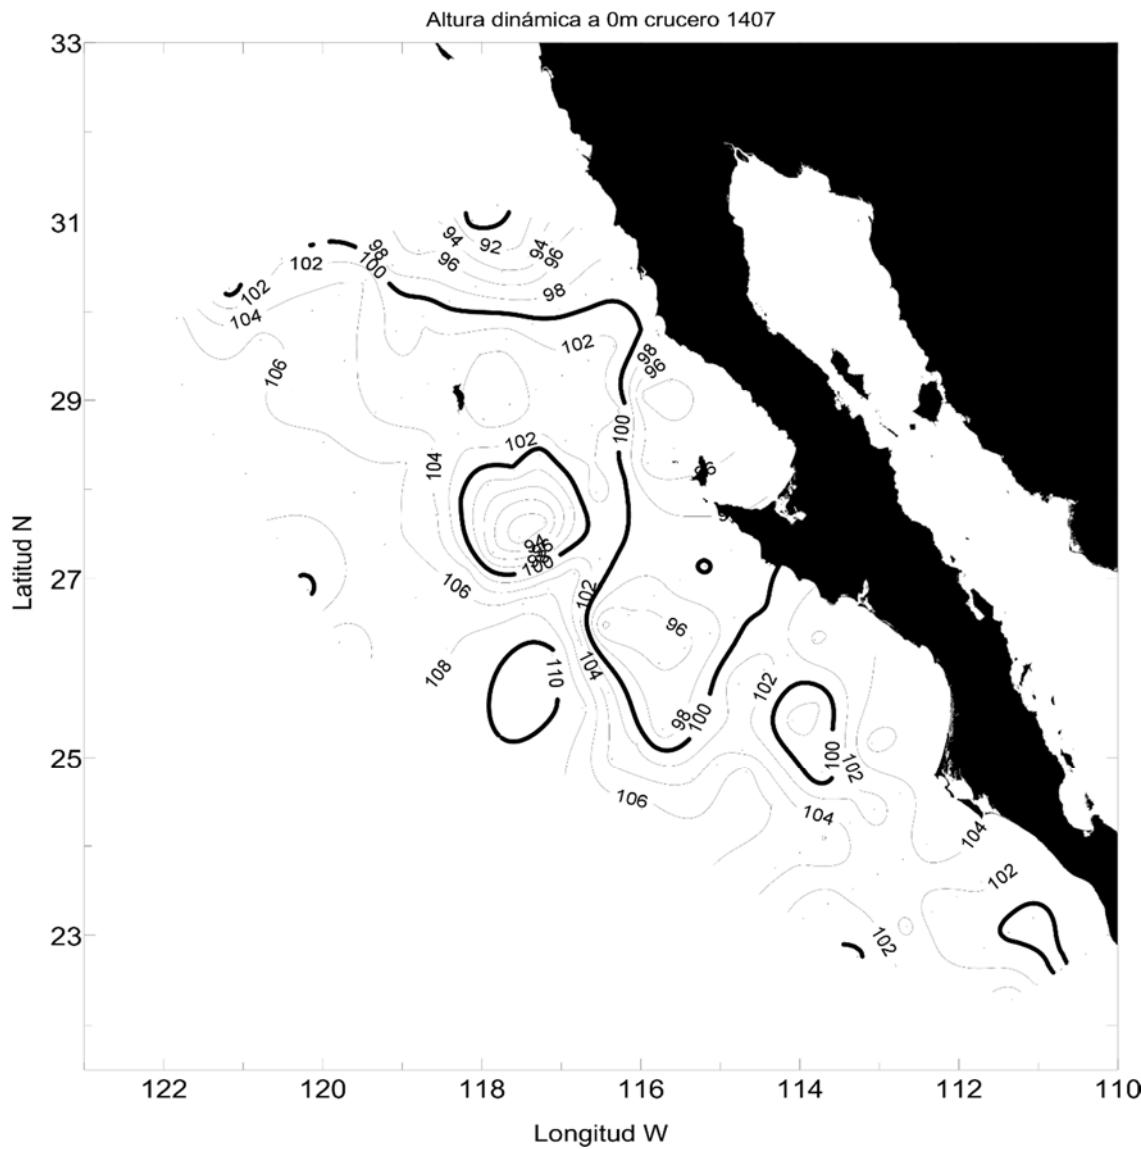

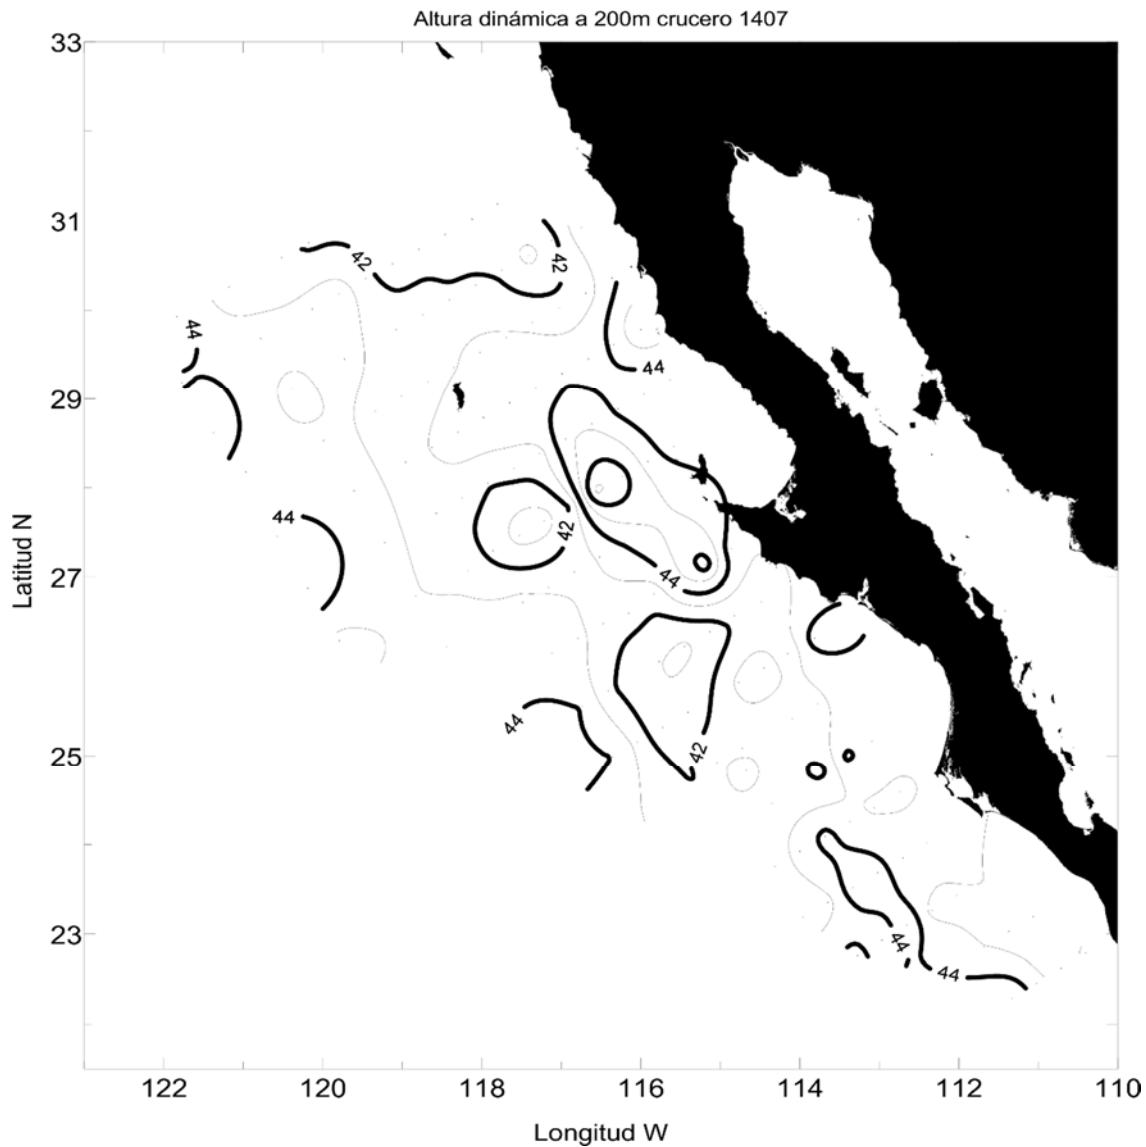

Figura 2: Diagrama TS. En rojo se muestran los datos del crucero 1407, en azul los realizados anteriormente (climatología para primavera). Para efectos visuales, se utilizaron sólo los datos a cada 10 db.

Los datos de temperatura y salinidad registrados en cada lance se utilizaron para los cálculos de densidad y de la anomalía geopotencial (altura dinámica) referido a 500 db. Los contornos de altura dinámica se muestran en las figuras 3 y 4, los cuales indican el comportamiento general de las corrientes en la superficie y a 200 m de profundidad. La altura dinámica fue calculada partir de la salinidad práctica para efectos de comparación con reportes anteriores.

Figuras 3: Altura dinámica (centímetros dinámicos) presentada en el crucero 1407 calculada en la superficie y referenciada a 500 m.

Figuras 4: Altura dinámica (centímetros dinámicos) presentada en el crucero 1407 calculada a 200m y referenciada a 500 m.

En el apéndice B se muestran los datos de cada lance, los cuales constan de tres componentes:

A) Encabezado: En éste se señala el número de la estación, el número secuencial del lance, la latitud y la longitud en grados, minutos y fracciones de minuto, la fecha del lance (DDMMMAA), la hora del lance (GMT), la profundidad del fondo marino en la estación (PROFTOT) y la profundidad máxima alcanzada en el lance (PROFLAN).

B) Datos tabulados: Se muestra una tabla con los datos a profundidades estándar (0, 10, 20, 30, 50, 75, 100, 125, 150, 200, 250, 300, 400, 500, 600, 700, 800, 900, 1000 db, y la máxima profundidad alcanzada). En la tabla se incluyen los datos de presión (PRES, db), temperatura (TEMP, °C), salinidad absoluta (SA, g kg⁻¹), oxígeno disuelto (OXI, ml l⁻¹) y anomalía de densidad (SIG-T kg m⁻³).

C) Gráfico del lance: Se muestra un gráfico de temperatura (línea azul, T), salinidad absoluta (línea roja, S), oxígeno (línea negra, O) y sigma-t (línea verde, σ_t) contra profundidad. La escala de cada variable se muestra en la parte inferior. La escala vertical no es igual para todos los lances.

En el Apéndice C se muestran contornos de temperatura, salinidad absoluta, sigma-t y *spiciness* a profundidades de 0, 10, 50, 100, 200 y 300 db. El Apéndice D muestra contornos verticales de temperatura salinidad y velocidad geostrófica para cada uno de los transectos de muestreo.

En el Apéndice E se muestran la concentración de clorofila-a determinada a partir de las muestras discretas de agua de mar.

Agradecimientos

Esta campaña oceanográfica y el presente informe fueron posibles solamente con el esfuerzo de muchas personas que estuvieron involucradas. En forma especial se agradece la colaboración del personal científico que participó a bordo del buque, el cual se relaciona en el Apéndice F. Se extiende el agradecimiento a la tripulación del BIPO por su invaluable colaboración y experiencia en altamar.
